Introduction

Sets of clinical codes that define conditions and events of interest are a key knowledge product in health data research. Documenting such lists is essential for transparency and repeatability, and there is great potential benefit in their sharing and reuse. We designed and implemented software to address these goals.

Objectives and Approach

Our goals were threefold:

1. Provide a graphical user interface (GUI) to allow easier creation of code lists, for less technical users.
2. Allow clear documentation of code lists, preserving the history of their creation and capturing metadata about their meaning, provenance, and use.
3. Facilitate programmatic access, so that the software is not just documentation but can be integrated into data preparation and analysis.

To these ends, we developed a web application using Python and PostgreSQL that allows creating, editing, and accessing via a GUI, as well as a REST API for integration into SQL, R, and other environments.

Results

It will be used within the SAIL Databank initially, with a public version for sharing across institutions planned. The code will be open source to enable further development.

Conclusion/Implications

We expect this tool to facilitate faster, higher-quality, more reproducible research in Wales and beyond. Hopefully it will be not just a standalone effort, but one small piece in a set of better tools and methods that will enable our field to truly realize the benefit of large linked datasets.
